Background

Interleukin-7 is a glycoprotein involved in the regulation of lymphopoiesis. Response of cells to IL7 is dependent on the presence of the interleukin 7 receptor (IL7R); the active receptor is a α/γ chain heterodimer. The $\gamma(c)$ chain, which also associates with the interleukin-2 receptor, serves primarily to activate signal transduction by the IL7R complex, while the α chain of IL7R determines specific signaling events through its association with cytoplasmic signaling molecules.
