# **Background**

The protein encoded by this gene is the CD3-epsilon polypeptide, which together with CD3-gamma, -delta and -zeta, and the T-cell receptor alpha/beta and gamma/delta heterodimers, forms the T-cell receptor-CD3 complex. This complex plays an important role in coupling antigen recognition to several intracellular signal-transduction pathways. The genes encoding the epsilon, gamma and delta polypeptides are located in the same cluster on chromosome 11. The epsilon polypeptide plays an essential role in T-cell development. Defects in this gene cause immunodeficiency. This gene has also been linked to a susceptibility to type I diabetes in women.

# **Validation Data**

Flow cytometry: 1X10^6 Raji cells (negative control,left) and Human PBMC (right) were surface-stained with PerCP Mouse anti-Human CD3 mAb (A26828,µl/Test,orange line) or PerCP Mouse IgG 2a isotype control (A26378,5 µl/Test,blue line). Non-fluorescently stained cells were used as blank control (red line).Cells in the Lymphocytes gate were used for analysis.
