# **Background**

The protein encoded by this gene is the CD3-epsilon polypeptide, which together with CD3-gamma, -delta and -zeta, and the T-cell receptor alpha/beta and gamma/delta heterodimers, forms the T-cell receptor-CD3 complex. This complex plays an important role in coupling antigen recognition to several intracellular signal-transduction pathways. The genes encoding the epsilon, gamma and delta polypeptides are located in the same cluster on chromosome 11. The epsilon polypeptide plays an essential role in T-cell development. Defects in this gene cause immunodeficiency. This gene has also been linked to a susceptibility to type I diabetes in women.

Flow cytometry: 1X10^6 Human PBMC were surface-stained with APC Rabbit anti-Human/Monkey CD19 mAb (A26220,5  $\mu\text{I/Test})$  and PE Rabbit IgG isotype control (A24172,5  $\mu\text{I/Test}$ ,left) or PE Rabbit anti-Human/Monkey CD3 mAb (A27110,5  $\mu\text{I/Test}$ ,right). Cells in the lymphocyte gate were used for analysis.
